MHS Conveyor Information	. 105

Chapter 1: IOM Introduction

1.1 Purpose

It is the intent of MHS Conveyor, through this manual, to provide information that acts as a guide in the installation, operation, and maintenance of MHS Conveyor CRUZ[®] belt conveyors.

This manual describes basic installation practices, assembly arrangements, preventive maintenance, and assists in replacement parts identification.

This service manual is intended for use by personnel who are knowledgeable of installation and safe working practices on conveyor systems.

Not all applications and conditions can be covered; therefore, this manual is to be used ONLY as a guide.

If additional copies of this manual are needed or if you have any question concerning the conveyor please contact your MHS Conveyor Distributor or MHS Conveyor Lifetime Services at 231-798-4547 or Fax 231-798-4549. Visit MHS Conveyor at <u>mhs-conveyor.com</u>.

Visit MHS Conveyor website at <u>mhs-conveyor.com</u> for maintenance videos and other application information.

1.2 Manual Structure

You s hould receive separate documentation for each product line of MHS Conveyor implemented in your installation. You can identify the respective product line on the back of the folder or on the cover sheet of the IOM (Installation Operation Maintenance) manual.

- IOM Product Name
- IOM PN = Part Number
- Revision Date (MM/DD/YYYY)
- Page Numbers

WARNING
 Pay attention to the safety instructions! Prior to working at or in the immediate vicinity of the system it is recommended that you make yourself familiar with the safety instructions included in the present document!

Chapter 2: MHS Conveyor Policies

2.1 MHS Conveyor Equipment Warranty

MHS Conveyor warrants that the material and workmanship entering into its equipment is merchantable and will be furnished in accordance with the specifications stated.

MHS Conveyor agrees to furnish the purchaser without charge any part proved defective within 2 years from date of shipment provided the purchaser gives MHS Conveyor immediate notice in writing and examination proves the claim that such materials or parts were defective when furnished. For drive components specific to XenoROL[®] (i.e. Xeno belts, slave Xeno belts, drive spools, standard and speed-up, and spacers), this warranty shall be extended to five years of running use, provided the conveyors are applied, installed and maintained in accordance with MHS Conveyor published standards. Other than the above, there are no warranties which extend beyond the description on the face hereof. Consequential damages of any sort are wholly excluded.

The liability of MHS Conveyor will be limited to the replacement cost of any defective part. All freight and installation costs relative to any warranted part will be at the expense of the purchaser. Any liability of MHS Conveyor under the warranties specified above is conditioned upon the equipment being installed, handled, operated, and maintained in accordance with the written instructions provided or approved in writing by MHS Conveyor.

The warranties specified above do not cover, and MHS Conveyor makes no warranties which extend to, damage to the equipment due to deterioration or wear occasioned by chemicals, abrasion, corrosion or erosion; Purchaser's misapplication, abuse, alteration, operation or maintenance; abnormal conditions of temperature or dirt; or operation of the equipment above rated capacities or in an otherwise improper manner.

THERE ARE NO WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, EXTENDING BEYOND THOSE SET FORTH IN THIS STATEMENT OF WARRANTY.

Rev 9/23/2016

2.2 MHS Conveyor Environment Standards

MHS Conveyor equipment is designed to be installed in a clean, dry warehouse environment. Exposure to extreme humidly, direct sunlight, blowing dirt or rain can permanently damage some components of MHS Conveyor. In particular, the curing agents in concrete are known to attack and degrade the urethane conveyor components.

When installing conveyor on a new construction site, be sure that the concrete is properly cured before setting conveyor on it. In addition, if conveyors are stored in the proximity of curing concrete, proper ventilation must be used to direct the curing agent fumes away from the conveyor.

Failure to comply with these guidelines will void the MHS Conveyor warranty on any failed components that result from these environment issues.

Chapter 3: Safety

3.1 MHS Conveyor Safety Recommendation

For additional safety information: MHS Conveyor agrees to the following safety instruction or guidelines listed within this manual. This is not to conflict with your state or legal requirements.

MHS Conveyor Recommends for maintenance or repair purposes, to incorporate a lock out or tag procedure. To ensure all starting devices, prime movers, or powered accessories are off before attempting to maintenance or repair.

The procedures below are designed to protect everyone involved with the conveyor against an unexpected restart. To include understanding of potential hazard of stored energy, which can exist after the power source is locked out.

For additional information, refer to the latest issue of ANSI Z244.1, American National Standard for Personnel Protection – Lockout/Tagout of Energy Sources– Minimum Safety Requirements. http://www.ansi.org/

OSHA 29CRF Part 1910.147 "Control of Hazardous Energy Sources (Lockout/Tagout)", which includes requirements for release of stored energy and OSHA Safety and Health Regulations for Construction 1926.555 Conveyors <u>https://www.osha.gov/</u>

3.2 Conveyor Design and Safety Guidelines

A safety risk evaluation is required for all of our standard equipment. The safety risk evaluation considers every potential hazard on the conveyor, weighs the probability and the severity of the potential injury, and addresses methods of mitigation to make the risk of injury either low or negligible. We use the ANSI B11 TR3 standards for all of our risk evaluation.

In addition, all of our equipment is designed to comply with the following national and industry standards:

ANSI 2535 – Safety Color Code

ANSI Z244.1 – Lockout/Tagout of Energy Sources

ASME B15.1 – Safety standard for Mechanical Power Transmission Apparatus

ASME B20.1 - Safety standard for Conveyors and Related Equipment

CEMA – Safety Standards and Labels

OSHA 1910.147 - The Control of Hazardous Energy

OSHA 1910.212 - General Requirements for all Machines

OSHA 1910.95 – Occupational Noise Exposure

Definitions:

ANSI = American National Standard Institute

ASME = American Society of Mechanical Engineers

CEMA = Conveyor Equipment Manufacturers Association

OSHA = Occupational Safety and Health Administration

3.3 ANSI Standards for Conveyors

It is essential for safe and efficient system operation that safety information and guidelines presented here are properly understood and implemented.

MHS Conveyor recognizes American National Standard Institute (ANSI) booklet entitled <u>Safety</u> <u>Standards for</u> <u>Conveyors and Related Equipment B20.1</u>. For more information go to: <u>http://webstore.ansi.org/default.aspx</u>

With any piece of industrial equipment, conditions exist that might cause injury to you or your coworkers. Because it is not possible to describe each potentially hazardous situation that might develop, you must be alert at all times for unsafe conditions. To avoid injury, use maximum possible care and common sense and adhere to all safety standards.

Take special care while maintaining and inspecting electrical equipment and devices. All personnel working on or around the system should be aware of, and adhere to, all **CAUTION**, **DANGER**, and **WARNING** signs.

Labels or signs are posted to reduce the risk of injury to all personnel. Never assume that the signs and notices are applicable only to inexperienced personnel. Maintain signs in a legible condition. Contact your supervisor to post additional safety signs if you feel they are necessary. <u>http://www.ansi.org/</u>

ANSI Conveyor Safety Rules

Conveyor safety rules, as well as specific regulations and guidelines listed in this publication:

- DO NOT touch moving Conveyor parts.
- DO NOT walk, ride, or climb on the Conveyor.
- DO NOT operate the Conveyor with chain guards or other protective guards removed.
- Keep jewelry, clothing, hair, etc., away from the Conveyor.
- Know the location and function of all start/stop devices and keep those devices free from obstruction.
- Clear all personnel from the equipment before starting the Conveyor.
- DO NOT attempt to clear product jams while the Conveyor is running.
- Allow only trained and authorized personnel to maintain or repair Conveyor equipment.
- DO NOT load the Conveyor beyond specified design limits.
- DO NOT attempt to make repairs to the Conveyor while it is running.
- DO NOT modify equipment without checking with the manufacturer.
- DO NOT operate or perform maintenance on equipment when taking any type of drug, sedative, when under the influence of alcohol, or when over fatigued.
- Report any unsafe condition to your supervisor or maintenance staff.

3.4 CEMA Standards for Conveyor

The Conveyor Equipment Manufacturers Association (CEMA) provides safety information related to conveyor systems. There are <u>Conveyor Safety Video</u> and <u>Conveyor Safety Poster</u> produced by CEMA.

MHS Conveyor recommends these videos for training and education purposes as part of a safe working environment around conveyor equipment. The videos introduce awareness of operations, personnel, maintenance technicians, and management to safety hazards commonly associated with the automated material handling conveyor equipment.

The safety posters reviews important safety labels and are intended to be posted in public places as a day-to-day reinforcement of good safety practices. These posters can be downloaded from the CEMA Website at http://www.cemanet.org/safety-label-posters or for more information for both the safety poster and the videos can be purchased from CEMA. Visit their website – www.cemanet.org/safety-label-posters or for more information for both the safety poster and the videos can be purchased from CEMA.

For additional information or contact them at:

CONVEYOR EQUIPMENT MANUFACTURERS ASSOCIATION

5672 Strand Ct., Suite 2 Naples, Florida 34110 239.514.3441

CEMA Safety Label Meanings

ANSI Z535.4 – Product Safety Signs and Labels

The word or words that designate a degree or level of hazard seriousness. The signal words for product safety signa are: DANGER, WARNING, and CAUTION.

DANGER -Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury. This signal word is to be limited to the most extreme situations.

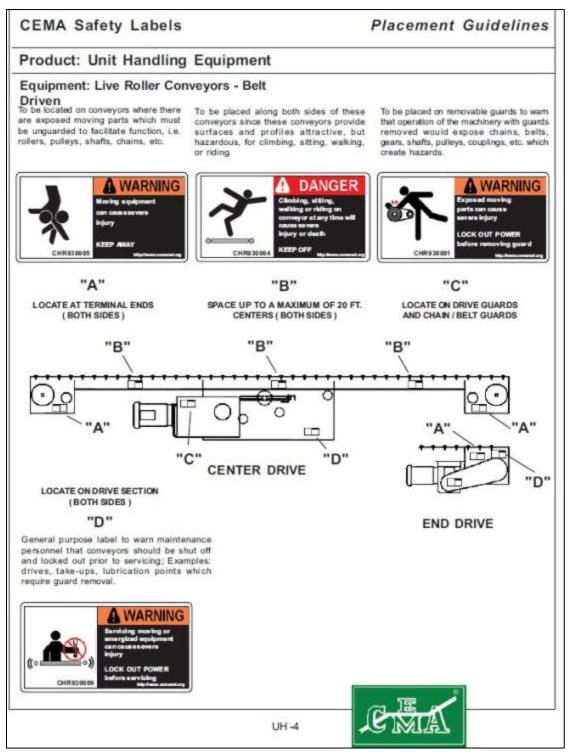

WARNING – Indicates potentially hazardous situation which, if not avoided, could result in minor or moderate injury. It may also be used to alert against unsafe practices.

CAUTION – Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury. It may also be used to alert against unsafe practices.

http://www.cemanet.org/cema-safety-label-meanings/

3.4.1 CEMA Unit Handling Standard

3.4.2 CEMA Poster for Package Conveyor

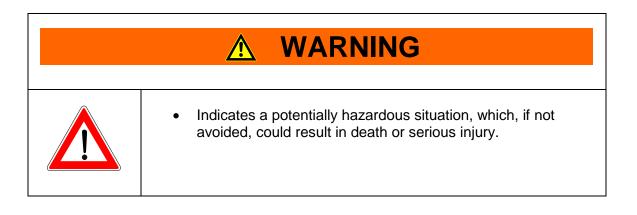

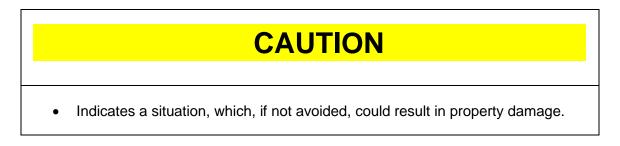

3.5 Warnings and Safety Instructions

Failure to follow the instructions and cautions throughout this manual and warning label on the conveyor may result in injury to personnel or damage to the equipment.

Your MHS Conveyor is powered by a motor and can be stopped only by turning off electrical power to the motor. As with all powered machinery, the drive-related components – including sprockets, chains, shafts, universal joints, and pneumatic devices – can be dangerous. We have installed or provided guards to prevent accidental contact with these parts, along with warning labels to identify the hazards.

Special attention must be paid to the following areas of this manual:

Safety: Always lock out power source and follow recommended safety procedures.

3.5.1 Safety Warnings

WARNING

- After maintenance, REPLACE guards immediately.
- Keep ALL warning labels clean and clear of any obstructions.
- Never remove, deface, or paint over WARNING or CAUTION labels. Any damaged label will be replaced by MHS Conveyor at no cost by contacting Lifetime Services.
- It is very important to instruct personnel in proper conveyor use including the location and function of all controls.
- Special emphasis must be given to emergency stop procedures.
- It is important to establish work procedures and access areas, which do not require any part of a person to be under the conveyor.
- It should be required that long hair is covered by caps or hairnets.
- Loose clothing, long hair, and jewelry must be kept away from moving equipment.
- Maintain enough clearance on each side of all conveyor units for safe adjustment and maintenance of all components.
- Provide crossovers or gates at sufficient intervals where needed to eliminate the temptation for personnel to climb over or under any conveyor.
- Walking or riding on a moving conveyor must be prohibited.
- Before performing maintenance on the conveyor, make sure the start-up controls are locked out and cannot be turned on by any person other than the one performing the maintenance.
- If more than, one crewmember is working on the conveyor, EACH CREW MEMBER MUST HAVE A LOCK ON THE POWER LOCKOUT.
- All pneumatic devices must be de-energized and air removed to prevent accidental cycling of the device while performing general maintenance.
- Make sure all personnel are clear of all conveyor equipment before restarting the system.
- Before restarting a conveyor which has been stopped because of an emergency, an inspection of the conveyor must be made and the cause of the stoppage determined. The starting device must be locked out before any attempt is made to correct the cause of stoppage.

3.6 MHS Conveyor Controls Safety Guidelines

The following basic conveyor control safety guidelines are recommended by MHS Conveyor even though Business Partner may or may not purchase conveyor controls from MHS Conveyor. The items listed deal with applications of controls equipment. <u>The actual installation of the equipment must always follow the National Electric Code and all other local codes</u>.

Start-up Warning Horn

Ideally, all conveyors should be within sight of the conveyor start pushbutton. This allows the operator to verify that no one is touching the conveyor or would be in danger if the conveyor were to start up.

If it is not possible to see the entire conveyor being started from the start pushbutton location, then some form of audible warning device is required. It could be a horn, buzzer, bell, or anything unique to that conveyor for that location. It should be loud enough to be heard at any point on the conveyor system. It should sound for approximately five seconds after the start pushbutton is pushed, prior to the actual running of conveyor. Any auxiliary equipment such as vertical lifts, turntables, etc., should also be included in the warning circuitry.

Conveyors that stop and restart under automatic control could also require a horn warning prior to restarting. If it is not easy to distinguish the difference between a fully stopped conveyor system and a momentarily stopped conveyor section, then it is advisable to add a warning horn. All conveyor sections that stop and restart automatically should be marked with appropriate signs or labels.

Start Pushbuttons

Start pushbuttons should be the flush type or guarded such that inadvertently leaning against them will not actuate the conveyor. They should be provided with a legend plate clearly defining which conveyors will be started.

Stop Pushbuttons

Stop pushbuttons should be the extended type such that any contact with it is sufficient to stop the conveyor. They would also be provided with a legend plate clearly defining which conveyors will be stopped.

Operator Controls

Additional operator controls should be designed into the system with the same guidelines that go into start and stop pushbuttons, depending upon their function. Devices which are repeated on multiple control stations, such as emergency stops, should be located at the same relative location on each station (such as lower right corner).

Emergency Stops

All locations where an operator must work directly at the conveyor should be protected by an emergency stop. An operator should not have to move from where he is to actuate the emergency stop.

Conveyors in areas of high pedestrian traffic should also be protected by emergency stop devices.

For all other instances, emergency stops should be located throughout a system such that it is possible to shut down the system without having to walk too far. In these instances the emergency stop is used more to protect the equipment from damage than to protect personnel.

Emergency stops can be of the pushbutton or cable operated switch type. The pushbutton type should be a red, mushroom head maintained pushbutton which requires resetting after it is actuated. Cable operated switches should trip by pulling the cable, and require resetting at the switch.

Actuating an emergency stop must drop-out the start circuit, requiring restarting the system using the start pushbuttons provided.

An emergency stop should normally stop all conveyors in the system. Very large systems may involve dividing a system into zones of control based on proximity of personnel, safety hazards, walls obstacles, etc.

Controls Logic

Solid state controls logic devices, such as programmable controllers are used extensively for conveyor control. They are very reliable, but a hardware failure or software bug would cause an output to function erratically. For this reason, start circuits, warning horn circuits, and emergency stops should usually be configured using conventional relay logic.

Safety Switches

All conveyor control cabinets and motors should be provided with safety (or disconnect) switches. These switches must have provisions for padlocking. As required for maintenance, equipment should be locked in the off position.

Special Devices

Special devices and equipment such as vertical lifts, turntables, high speed conveyors, etc., all have unique design and safety requirements. These should be looked at in each case to determine what the requirements might be.

Rev 08/22/2011

Chapter 4: CRUZbelt Introduction

4.1 CRUZbelt Features

This manual provides information for installing, operating, and maintaining your MHS Conveyor CRUZ[®] belt conveyor. A complete parts list has been provided, along with a list of recommended spare parts. Important safety information is included throughout this manual.

MHS Conveyor CRUZ[®] belt is considerably different than other belt conveyor. An understanding of this manual will help you take advantage of the many unique features of CRUZ[®] belt.

Features and Benefits:

- CRUZ[®] channel side frames have integrated cable trays.
- Side frames allow optional shrouds for a sleek appearance.
- Slider bed frames are interchangeable with roller bed frames.
- All intermediate bed sections can be made into end beds.
- End pulleys, snubbers, and take-up pulleys are adjusted with cams. By eliminating the usual threaded rods, adjustments are made in seconds.
- Innovative tube spanners eliminate bed racking.
- Alignment sight holes allow all pulleys to be easily squared before startup.
- Motor mounting allows chain adjustment without affecting sprocket alignment.
- This manual is arranged in the suggested order of installation.

Chapter 5: CRUZbelt Receiving & Site Preparation

General

MHS Conveyor CRUZbelt units are shipped in subassemblies. These subassemblies are packaged to guard against damage in shipment, when handled properly.

Examination immediately following unloading will show if any damage was caused during shipment. If damage is evident, claims for recovery of expenses to repair damage or replace components must be made against the carrier immediately. While unloading, a check must be made against the Bill of Lading, or other packing lists provided, to confirm full receipt of listed items.

Preparation of Site

After the conveyor is received, move it to the installation, or designated dry storage, area as soon as possible. Clean up all packing material immediately before parts get lost in it. Loose parts should remain in the shipping boxes until needed.

Prior to starting the assembly of the conveyor, carefully check the installation path to be sure there are no obstructions that will cause interference. Check for access along the path needed to bring in bed sections and components closest to the point where they are needed. It is often necessary to give the area, along the system path, a general cleanup to improve installation efficiency, access, and accuracy.

5.1 Part Inventory & Identification

Label Identification

Each subassembly is shipped completely assembled except typical loose parts, which are in boxes with the subassemblies. Separate the conveyor subassemblies by types for inventory and ease of locating during installation.

An identification label is attached to the charged end of the center bed of each CRUZbelt Module unit.

Labels **may** contain the following information:

Item number Description Job Number Mfg. Number Tag number (if specified) Assembler's clock number Date of manufacture QR (Quick Response) bar code Scan bar code for IOM manual

Scan the QR code to retrieve the IOM Manual, if nothing happens; check your scanner settings to make sure the QR Label setting is enabled.

On the supports, the tag is located on the bottom side of the foot.

On special devices, it is located on a convenient flat surface that is not offensive to the appearance of the equipment but is still accessible for viewing. These numbers can be cross-referenced against the packing list.

Loose parts are boxed and shipped separately.

You should have all conveyor sections and supports for a particular conveyor prior to installation. It is cost-effective to identify and procure any missing parts before they are needed for assembly.

Small items like nuts and bolts are weigh-counted and packaged by size and type.

Chapter 6: CRUZbelt Application & Installation Details

6.1 General Procedures

The following procedures are to be used as guidelines only. Specific installation methods will vary somewhat depending on available equipment on site and each installer's preferences based on experience.

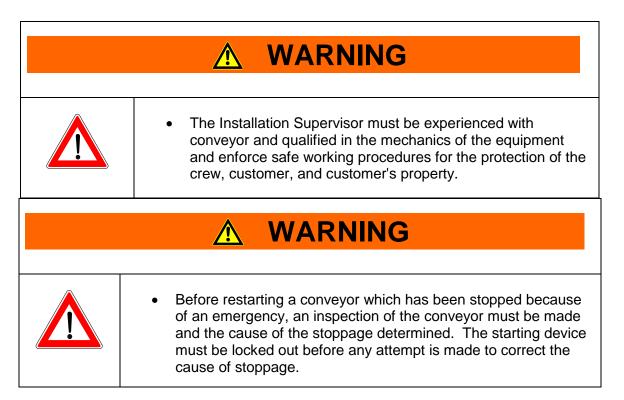

Dimensional Reference Points

The path of each conveyor in the system is determined by establishing a reference point at each end. The centerline of the conveyor is established and a chalk line is snapped between these points.

Conveyors should be installed with the centerline of the bed matching the centerline of the conveyor path within 1/8" of true center. Locate and mark the center of the crossmembers at each end of the conveyor. Use a plumb line or other applicable device to ensure accuracy to the chalk line.

Always carry out a thorough check for any obstructions such as building columns, manholes, etc. It may be necessary to reroute the conveyor to avoid the obstruction. In this case it would be advisable to begin installation at this point, using the obstruction as a reference point (Datum), and install the sections in either direction as required.

All conveyor sections must be checked for squareness prior to installation as "racking" or being knocked out of square may have occurred during shipping and handling.

6.2 Electrical / Gearmotor

All motor controls and wiring must conform to the National Electrical Code as published by the National Fire Protection Association and approved by the American National Standards Institute, Inc. In addition, since specific electrical codes vary from one area to another, be sure to check with the proper authorities before starting the electrical wiring.

WARNING
 All Standard Gearmotor with brake Coil Rectifiers are Half- Wave and are suitable only for 480VAC.
Using standard Gearmotor with Brake at 240VAC will void the Gearmotor with brake warranty.
 Contact Distributor Services for the correct rectifier for your intended voltage if other than 400-480VAC.

The voltage of the motor will be stamped on the name plate. This voltage must match available voltage. Consult the wiring diagram on the motor for proper connections. If a single direction conveyor with a 3 phase motor runs the wrong direction, two leads must be switched to reverse rotation.

WARNING
 VFD s (variable frequency drive) motor controllers may not be directly connected to any Gearmotor with brake. Brake Coil Rectifier as they are not compatible and the motor/brake will not completely release.
 VFD connection to Brake Coil Rectifier will void Gearmotor with brake warranty.

Consult the wiring diagram of the inside cover of the starter and pushbutton for the proper electrical connections. Three phase drives require transformers to reduce the pushbutton and control circuit to 115 volts. If primary voltage is changed, the transformer must be changed, according to the wiring diagram found on the transformer.

NEMA enclosure ratings are as follows:

NEMA 1- Indoor use, provides protection against contact with internal components. Suitable for use in warehouse and distribution environments.

Gasket NEMA 1- Same use as NEMA 1, but with additional protection against dirt and dust.

NEMA 3- Outdoor use, designed to keep out rain and dust.

NEMA 4- Indoor and outdoor use, designed to keep out rain and dust.

NEMA 12- Indoor use, provides protection against dust, dirt, oil seepage, and dripping of non-corrosive liquids. Suitable for use in industrial environments.

NEMA 13- Indoor use, provides protection against dust, dirt, sprayed oil and non-corrosive liquids.

NOTE: All the controls logic, safety switches, and some special devices are covered by the original manufacturer's warranty.

Conveyor in areas of high pedestrian traffic should also be protected by emergency stop devices.

Emergency stops should be located throughout a system. Their location will depend on likely observation points and areas with special devices or interfaces between equipment.

Emergency stops can be a pushbutton or cable operated switch. The pushbutton should be mushroomstyle and red. The pushbutton must require resetting after actuation. Cable operated switches should trip by pulling the cable and require resetting at the switch.

An emergency stop should normally stop all conveyors in the system. Very large systems may involve dividing the system into zones of control.

Actuating an emergency stop must drop out the start circuit and require restarting the system using the start pushbutton.

WARNING
 Before restarting a conveyor, which has been stopped because of an emergency, an inspection of the conveyor shall be made and the cause of the stoppage determined. The starting device shall be locked out before any attempt is made to correct the cause of the stoppage.

Controls Logic

Solid state controls logic devices, such as programmable controllers, are used extensively for conveyor control. They are very reliable, but a hardware failure or software bug could cause an output to malfunction. For this reason, start circuits, warning horn circuits, and emergency stops should usually be configured using conventional relay logic.

Safety Switches

All conveyor control cabinets and motors should be provided with safety (or disconnect) switches. These switches must have provisions for padlocking. As required for maintenance, equipment should be locked in the OFF position.

Special Devices

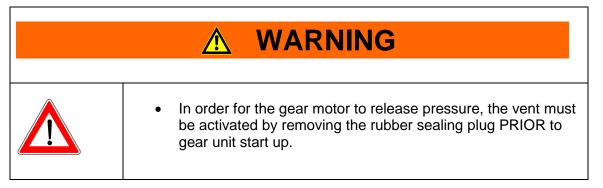

Special devices and equipment such as vertical lifts, turntables, high speed conveyors etc. all have unique design and safety requirements and should be evaluated individually.

6.3 Gear Motor Activation

PRIOR to systems activiation - Please inspect the gear unit for a vent and if applicable to the product remove the rubber sealing plug to activate. The vent is designed to allow excessive pressure to escape. Each gear unit should have a yellow instruction tag as shown below. The tag can be removed after the plug is removed.

Note: The rubber sealing plug is in place for shipping and storage purpose only.

Please check you gear unit for a vent and if applicable to your product, remove the sealing plug to activate. "<u>https://www5.nord.com</u>" Operation Manual for Gear Units (B1000).

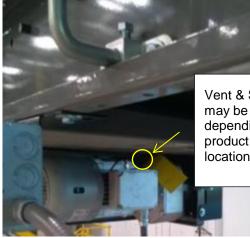

Note: Yellow tags may be tucked out of sight. Please inspect all motors for a vent and remove sealing plug, if present, to activate.

The following pictures are examples showing where vent plugs may be located depending on the product line and motor position.

Vent & Sealing Plug may be hard to see depending on the product line and motor location.

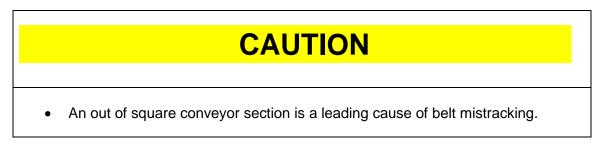

6.4 Squaring Conveyor

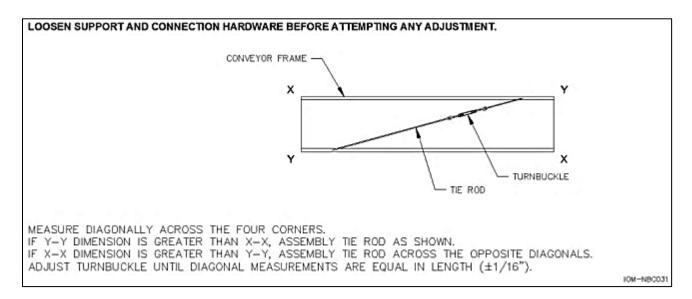

All conveyor sections must be checked for squareness prior to installation as "racked" or being knocked out of square may have occurred during shipping and handling. An out of square conveyor section is a leading cause of belt mistracking.

Measure diagonally across the four corners of the conveyor frame to determine if the frame is out of square. If the measurement is not equal between the two diagonals, the frame is not square. A "racked" conveyor will skew the rollers, causing the belt to wander off center.

The conveyor sections are joined together with welded butt plate connectors. If a conveyor section is determined to be out of square, adjustment must be made before proceeding to the next section. Correct the squareness of the conveyor frame by installing a tie rod along the longest diagonal dimension and adjusting the turnbuckle until the diagonal measurements are equal in length. It is important to loosen the support and connection hardware before attempting any adjustment.

If gaps appear between bed joints as a result of squaring the conveyor, take care not to "re-rack" the conveyor by pulling the sections together at the bed joints. Insert optional shim plates or washers to the required thickness to fill the gap before tightening the connection hardware. Verify the squareness of the conveyor after installation.

Squaring conveyor Kit# 1134766

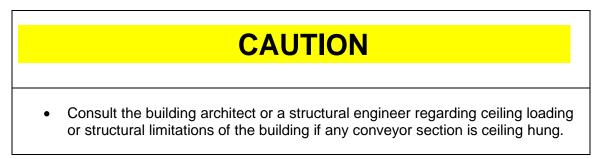

6.5 Elevations

All conveyor sections should be installed in accordance with the elevations shown on the drawings. In addition, they must be level across the frame width and length (if horizontal). Leveling of the frames is best done using a rotating laser level or builder's level.

After the first elevation is established at a critical point, the elevation of all other points shall be relative to this first point. Normal practice is to dimension the layout and measure elevations from the floor at each point of support.

As the conveyor system proceeds onto another floor or into another building or room, a new elevation will be measured from the floor at that point. The new elevation will then become the reference from subsequent elevations.

When installing an overhead system, the first elevation is measured from the floor and becomes the reference elevation point until a change in the elevation is shown on the layout. Any new elevation is also measured from the floor and becomes the new reference point. The process is repeated each time an elevation change occurs.

Component Orientation

Using your conveyor system layout drawing and the numbers on the I.D. tags of each component, position, and orient the conveyor section.

You must know:

The direction of product flow

The elevation height

How the drive is positioned

Charge and discharge end beds

IMPORTANT! Do not make alterations to the equipment without consulting with user's representative and MHS Conveyor. Unauthorized modifications to the equipment may impair its functions, create a hazardous condition, affect its useful life, and /or void the warranty.

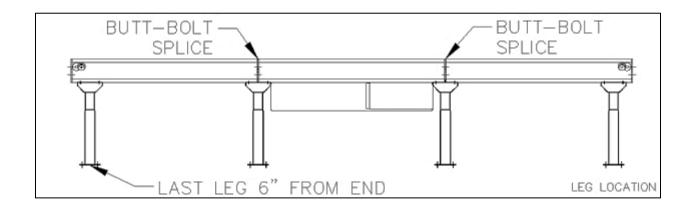

6.6 Support Arrangements

Floor Support Information

All supports are intended to be used at a conveyor seam or joint at the end of a unit. All CRUZbelt beds now have butt-bolt connections to allow supporting off center of a bed joint if necessary. Support CRUZbelt at each end and at every splice as shown below. Set all supports for unit to proper height.

Attach supports to both sides of drive.

On intermediate and end beds, attach one support on the end furthest from the drive.

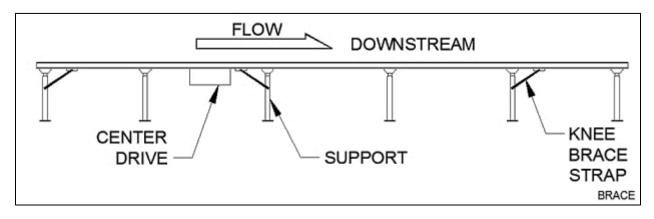

Leg elevations are shown on the elevation drawings. Leg elevation can also be set by subtracting 6-3/8" from the desired top of belt elevation.

NOTE:

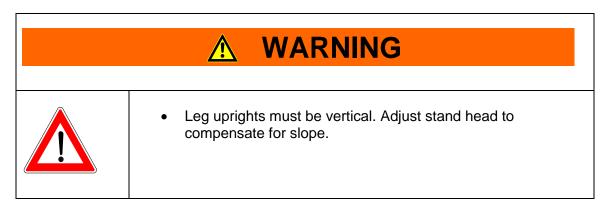

Top of Belt – 6 3/8" = Top of Support

If knee braces are required, they are installed on approximately 30' centers as shown below.

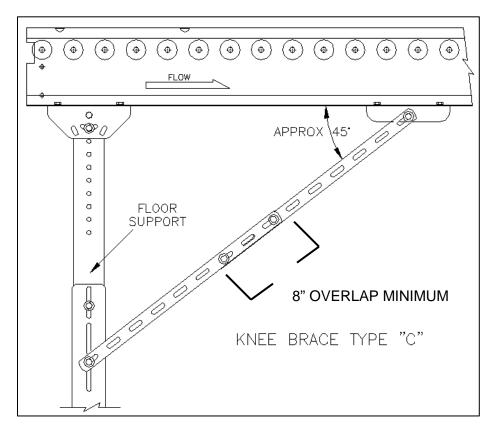

Note brace direction. Near a drive, the brace should be on the upstream side of the support. Elsewhere the brace should be downstream of the support. For maximum effect, the angle between the brace and the side frame must be between 30 and 45 degrees.

Supports over 48" high use a double knee brace (Type "C"). To make a double knee brace, bolt two straps together with a minimum 8" overlap.

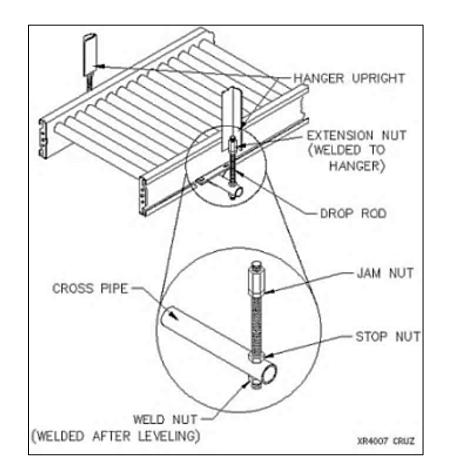

6.7 Ceiling Hanger Installation

MARNING
 Consult your distributor or a structural engineer to determine hanger and header steel sizes.

Install ceiling hangers as close to conveyor splices as possible, no further than 6' from a joint and no further than 12' apart.

Cross pipes, v-brackets, and related hardware are provided standard. Drop rods and hardware are optional.

Ceiling Hanger Sway Bracing

Sway bracing should be a minimum of 1-1/2" x 1-1/2" x 3/16" angle.

Secure sway bracing to the hanger upright near the conveyor and extend upward at an angle between 30 and 45 degrees.

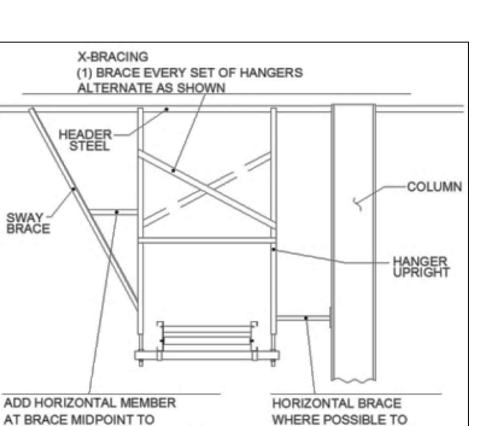

Brace horizontally to building structure where possible.

Hanger uprights over 12'-0" long must have a horizontal bridge as shown.

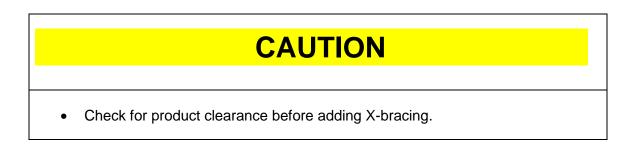

Sway bracing should be installed on every third hanger or 30'-0", whichever is less.

Install X-bracing as shown if bracing cannot be installed outside uprights.

Additional bracing should be used before and after curves, at drives, and at product divert points.

HORIZONTAL BRACE WHERE POSSIBLE TO BUILDING STRUCTURE.

SWAY BRACES OVER 12' LONG

6.8 Anchoring Ceiling Hangers

Open building steel:

The following references are from the American Institute for Steel Construction manual (AISC).

Welding of auxiliary steel (stringers or headers) to building steel is prohibited.

Drilling and bolting to building steel is not recommended and will be done only with the customer's written permission and certified engineer.

Clamping of stringers or headers to building trusses will normally be done only at panel points. Specific customer permission and load calculations by a qualified engineer are necessary to clamp between panel points.

Headers when used for short spans, such as between roof purlins, will be securely clamped to building steel. Stringers when used between headers may be welded or bolted to the headers directly or with suitable angle clips upon approval from certified engineer.

Concrete ceilings:

Anchor by drilling into concrete ceiling and inserting suitable bolt anchors.

Follow bolt manufacturer's recommendations for hole diameter and depth.

Anchor each hanger with four bolts (two per upright) minimum 1/2" diameter.

Heavier loads like drives or areas of vibration require 5/8" diameter through bolts with backup plates or multiple anchor bolts.

Wood joists/beams:

Hangers may be attached directly to the joists providing the load rating of the building will permit. Attach each hanger to the vertical side of the joist in two places, one above the other. Drill through the joist in the upper position and secure with a ½" diameter through bolt with backup plate or heavy washer. A ½" diameter lag bolt may be used in the lower position.

When a header is required to support the load, it must bridge across two or more joists. Attach as described above. Hanger uprights may then be secured to the header.

Concrete or masonry walls:

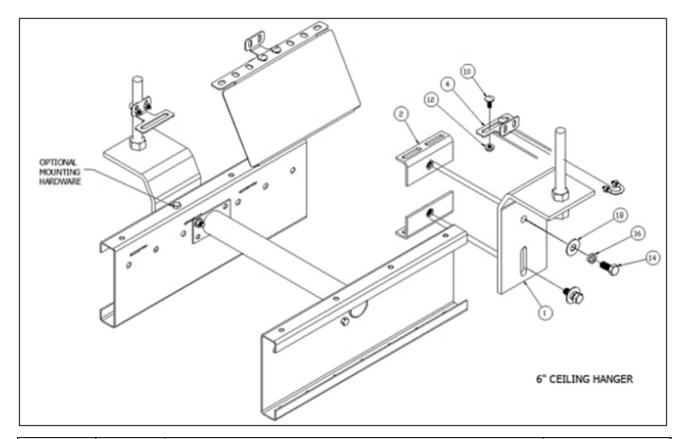

Support equipment by drilling into the wall and inserting suitable bolt anchors.

Use a ½" diameter through bolt with backing plate should the load or wall conditions warrant.

WARNING						
	 Consult a structural engineer to determine which anchoring method will support your load. All attachments to building must be approved by owner as well as certified engineer.

6.12 Conveyor Set Up

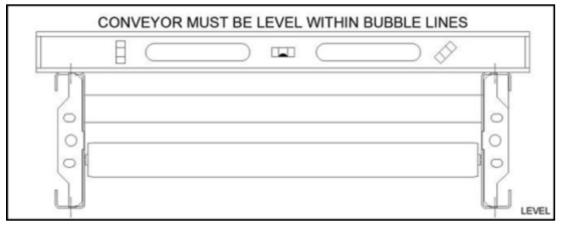

Place each bed in position per layout drawing.

Bolt bed butt connectors together.

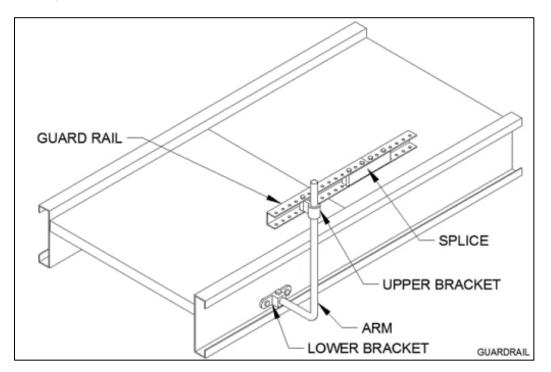

Set final elevation and level unit. Conveyor must be level side-to-side and along conveyor length as shown below:

Tighten support bolts and anchor to floor.

Install any required guard rail as shown:

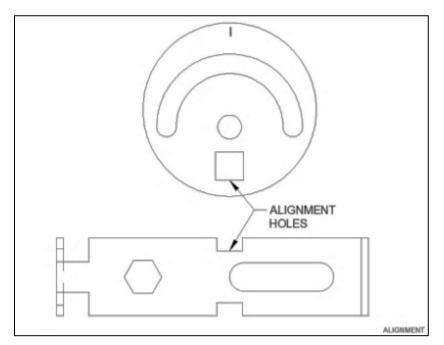

Conveyor must be level

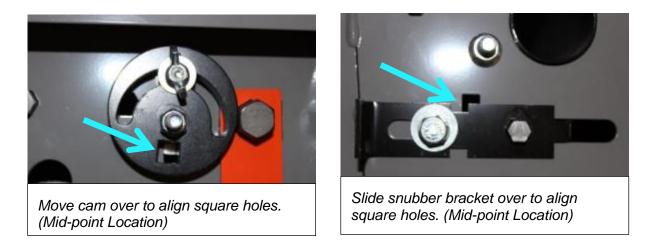

Guardrail assembly

Square end pulleys and snubbers using alignment holes. Move cam or snubber bracket until the 3/8" square alignment hole is in line with the 3/8" square in the bed frame. A 3/8" key stock can be inserted into the holes for quick alignment.

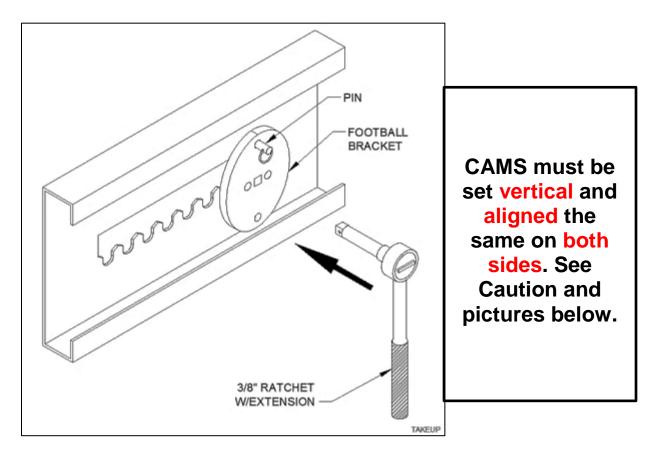

Hole Alignment

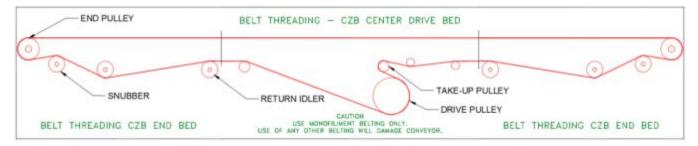

Locate drive. Remove both black plastic translucent shrouds and quick-release pins. Use a 3/8" ratchet with extension in the square hole of one football bracket to roll the take-up as shown. Make sure the belt is not rubbing on the side channels.

To view CRUZbelt Take-up and Tracking video visit: <u>http://mhs-conveyor.com/media-center/maintenance-videos/80-belt-conveyor</u>

Thread belt through conveyor. Labels on drive beds show specific threading. A general belt path is shown below:

6.13 Standard CRUZbelt Lacing

	CRUZbelt LACING INFORMATION					
LACING:	CLIPPER: UCM36SS12 316 STAINLESS STEEL (INSTALL LACE ON BELT WITH .065 DIA LACE PIN THRU HOOKS (P/N 1100706)					
LACING PIN	CLIPPER: DSS065 316 STAINLESS STEEL WIRE CORE IN A .065 WHITE DURAPIN COATING (P/N E0034789)					

Pull belt ends together and insert lacing pin.

Tension belt by rolling a football bracket away from the motor. A standard 3/8" drive ratchet will provide correct belt tension with ease. Do not over tension the belt by using a "cheater bar" on the ratchet or using two people with ratchets. Belt should be just tight enough to drive the product.

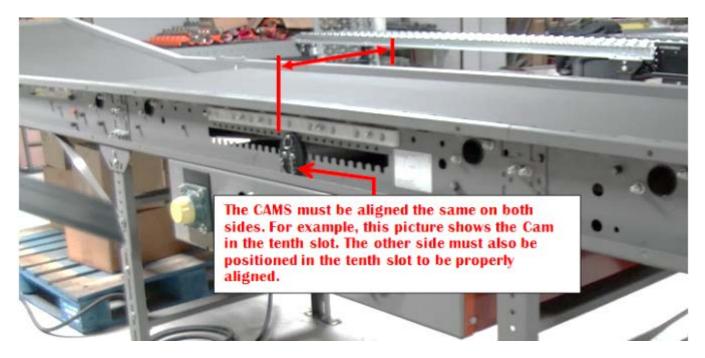

Replace quick-release pins into both football brackets as shown on bed label. One football bracket may need to be separately aligned slightly to insert the pin. Replace drive shrouds.

CAUTION

- **Do not** run the conveyor without replacing both quick release pins.
- The CAM (football bracket) must be vertical on both sides and the Cam must be aligned in the same vertical hole position on both sides. The Cam this must not be offset from each other. (See pictures below)
- **Do not over tighten belt** as this causes excessive stress on the Drive Drum Shaft and associated bearings.
- **Excessive belt tension** will cause premature failure of the take-up assembly.

The Cams must be vertical on each side.

The Cams must be aligned the same on both sides.

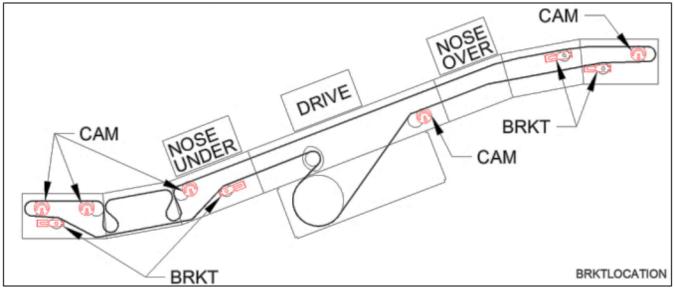

6.14 Belt Tracking

ALL PULLEYS AND SNUBBERS MUST BE SQUARE and conveyor must be level prior to tracking the belt. Align the 3/8" square in the cams and snubber brackets with the corresponding square in the bed frame. (See "Conveyor Set-up" section). Conveyor must be wired to run the correct direction. Belt should be tensioned tight enough to drive the heaviest product.

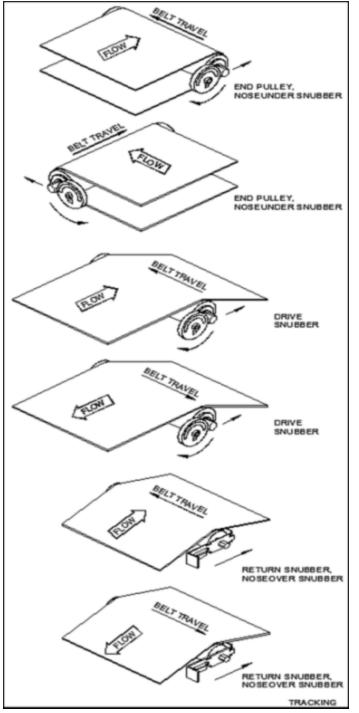

Belt tracking is accomplished by moving the snubber (belt return roller) tracking brackets (fine adjustments) first from their squared positions. The use of the tracking cams is a coarse adjustment that should only be used if necessary.

Tracking cams are located on the end pulleys, the drive snubbers, and near the middle of noseunders. Snubber tracking brackets are located near the ends of the conveyor on the return belt snubber/carrier rollers and near the middle of noseovers.

6.14.1 Tracking scenarios

NOTE: Flow refers to belt surface flow direction not necessarily product flow.

NOTE: Belt moves towards the end of the pulley that it contacts first.

CRUZbelt is slightly different to track than other conveyors. Since the belt is only 7/16" narrower than the between frame dimension, some belt contact with the side frame is expected. However, the belt must not be allowed to contact the frame near any end pulley or snubber roller.

CAUTION Belt must not be allowed to contact the side frame near an end pulley or a snubber roller.

Some basic tracking information:

The belt moves TOWARD the end of a pulley it contacts first.

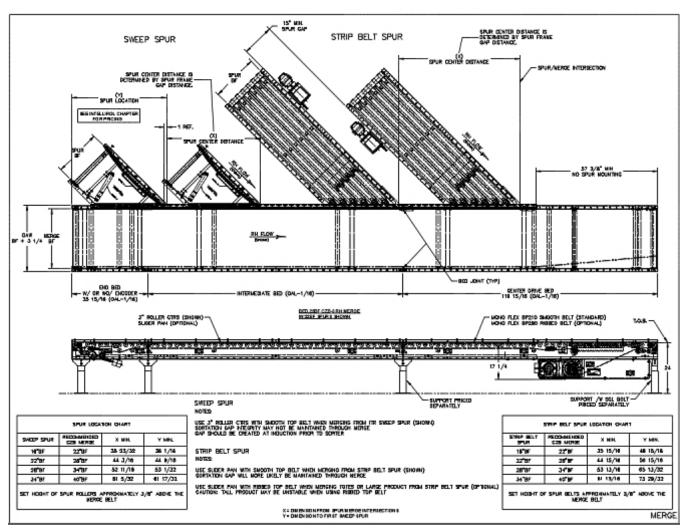

Use snubber tracking brackets before using tracking cams. End pulley tracking is used as a last resort.

Tracking brackets and cams affect belt movement on the next device DOWNSTREAM from the adjusted pulley. Find the nearest bracket or cam upstream from the problem area and adjust as shown.

Adjust bracket or cam slightly and watch belt for several belt revolutions before continuing to ensure the belt location is stabilized.

CAUTION

 CRUZbelt conveyor must be used with mono-filament belting. Use of any other belting will damage conveyor. Consult your MHS Conveyor distributor for belt specifications.

Chapter 7: CRUZbelt Merge

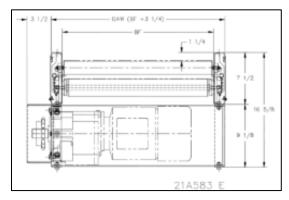

Standard Equipment

Belt:

Smooth top belting is used when merging which pulls the product downstream and maintains orientation. The belt is a black smooth top PVC with monofilament carcass, 100 lbs. per inch of width tensile strength; clipper lacing.

NOTE: CRUZbelt requires a monofilament belt. Installation of any other type of belt will damage the internal components of CRUZbelt. Any CRUZbelt conveyor that has any type of belt other than a monofilament belt will immediately and permanently **VOID all MHS Conveyor warranties**.

CRUZBELT WIDTH INFORMATION					
Overall Width	19-1/4"	25-1/4"	31-1/4"	37-1/4"	
Between Frames	16"BF	22"BF	28"BF	34"BF	
Belt Width	15-9/16"	21-9/16"	27-9/16"	33-9/16"	

Slider Bed:

A formed slider pan between CRUZchannel frames with welded bed connectors and painted crossmembers make up the frame. Return rollers are 1.9" diameter, with precision bearings and 7/16" hex axles.

Belt-on-Roller Bed:

Belt on roller bed 3" roller centers. 1.9" O.D. 16 ga. plated shell with ABEC-1 precision bearing and 7/16" hex axle between CRUZchannel frame with welded bed connectors and painted crossmembers make up the frame. Snubber rollers are 1.9" diameter, with ABEC-1 precision bearing and 7/16" hex axle. Rollers installed at factory through 34" BF. Greater widths rollers shipped separately.

Brake motors are NOT recommended to be used with a VFD controller unless the brake is wired separately. Typical voltage for brake is 460 VAC.

A VFD or soft start is required for all drives that run at or above 200 FPM. Use the acceleration and deceleration when stopping or starting the drive.

Application

Sweep Spurs should be used when purging out a line to a final downstream accumulator prior to induction. Sweep Spurs discharge products on to the CRUZbelt Merge at rates up to 200 CPM.

The Strip Belt Spur should be used when there is a requirement to set the destination at the strip belt merge discharge and track the product from the strip belt spur to the sortation diverts location.

CRUZbelt Merge Beds

CHARGE (END) BED:

Lenath: 3'-0"

Roller Centers: Slider and 3" RC. Comes with or without encoder.

INTERMEDIATE BED

Lengths: 10'-0" and 5'-0"

Roller Centers: Slider and 3" RC

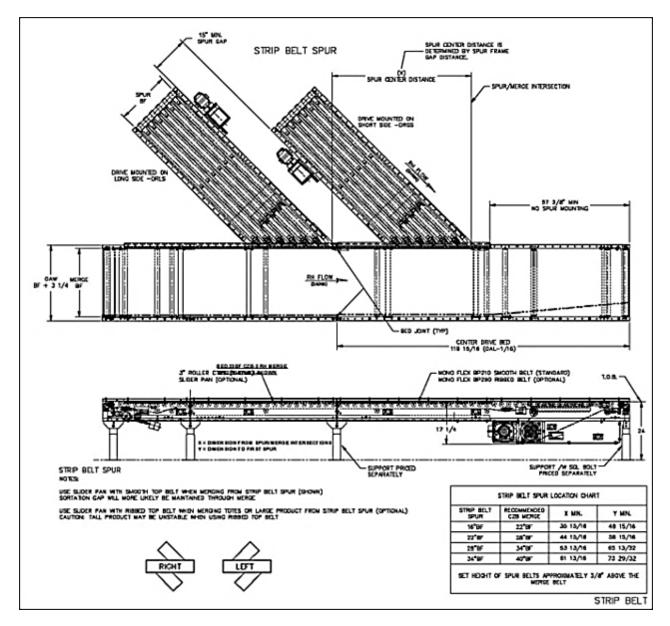

DRIVE / DISCHARGE BED

Lenath: 10'-0"

Roller Centers: Slider and 3" RC

DRIVE-TRAIN:

Use CRUZbelt center drive trains.

Chapter 8: CRUZbelt & Strip Belt Spur

Standard Equipment

Belt:

Black rough top with clipper lacing.

CRUZBELT WIDTH INFORMATION					
Overall Width	19-1/4"	25-1/4"	31-1/4"	37-1/4"	
Between Frames	16"BF	22"BF	28"BF	34"BF	
Belt Width	15-9/16"	21-9/16"	27-9/16"	33-9/16"	

Slider Bed:

A formed 12 ga. slider pan between 7-1/2" deep x 1-5/8" CRUZ side channels and round tubing crossmembers make up the frame with welded bed connectors. Return rollers are 1.9" precision bearings and 7/16" hex axles.

Motor:

Motor, 1 to 2 HP 208/230/460 volt, 3-phase, 60 Hz, incline helical gearmotor.

Brakes are available in 460 VAC.

A VFD or soft start is required for all drives that run at or above 200 FPM. Use the acceleration and deceleration when stopping or starting the drive.

Brake motors are not recommended to be used with a VFD controller unless the brake is wired separately. Typical voltage for brake is 460 VAC.

Speed:

Speed 103 FPM to 410 FPM available.

The Strip Belt Spur should be used when there is a requirement to set the destination at the strip belt merge discharge and track the product from the strip belt spur to the sortation diverts location.

Chapter 9: CRUZbelt Commissioning of Equipment

General

Commissioning of the equipment can best be defined as the final adjustments and test of the installed equipment required for its proper operation. The need for commissioning is inherent, since the individual components of equipment are brought together at the installation site to operate as a system.

Mechanical and electrical commissioning is most often carried out simultaneously. Commissioning must simulate the actual operation of the system as close as possible to demonstrate the ability to perform reliably at the specified rate in the prescribed operational sequence.

During the Commissioning Phase, it is necessary to load the equipment with product to be conveyed, which provides the means of detecting those areas requiring adjustment. Personnel will be required to support operational functions. This may serve as part of operator training and familiarity with the system. During the commissioning activity, special attention should be directed toward personnel safety. No unnecessary risks should be taken that would endanger the safety of any personnel. All personnel must familiarize themselves with all safety features of the system such as emergency stops and motor disconnects.

Mechanical Static Checkout

(No power to the conveyor.)

Follow the belt path through the entire conveyor. Ensure lacing is straight and fastened correctly.

Visually inspect the installation. Is the conveyor straight? Is the conveyor level within bubble lines from side to side? From end to end?

Check guard rail clearance to product.

Eliminate all catch points.

Check conveyor elevations.

All bolts and set screws tight.

Check product clearance to overhead structures.

Simulate all operational functions with actual product.

All guards in place with proper clearance.

All OSHA required guards in place on walkways, catwalks, ladder-ways, floor openings, etc.

All labels and warning signs in proper place, unobstructed.

Mechanical Dynamic Checkout

(Power to the conveyor, but no product on it.)

Turn the motor ON. With the belt moving make sure each belt has proper tension. Check the belt tracking.

Chapter 10: CRUZbelt Preventive Maintenance &

Troubleshooting

General PM

Preventive maintenance will save expensive downtime, wasted energy costs, and increase life of components. An accurate record keeping system will track component servicing history.

MHS Conveyor recommends periodic maintenance intervals. Inspection intervals may vary with load, speed, hours of operation, ambient temperature, humidity, etc. Intervals can be established by starting with a fairly frequent maintenance at first, and then lengthens the intervals as justified by observation of the need, based on history. The following schedule is based on 5 days per week, 8 hours per day operation under normal conditions.

Daily

Listen to everything for unusual noises or vibration. Visually inspect to see that conveyor sections are clear and free of debris. Check to see that all safety guards are in place. Check for loose bolts or parts.

Weekly

Check belt for wear and proper tension. Check belt tracking. Check belt lacing.

Monthly

Inspect Gearmotor for leaking seals and the breather plug for dirt and debris. Inspect chain & sprocket, pulley, and belts. See below for details.

Semi Annual

Check the bearings for grease (Do not over grease). Inspect pulleys and rollers for build-up of debris.

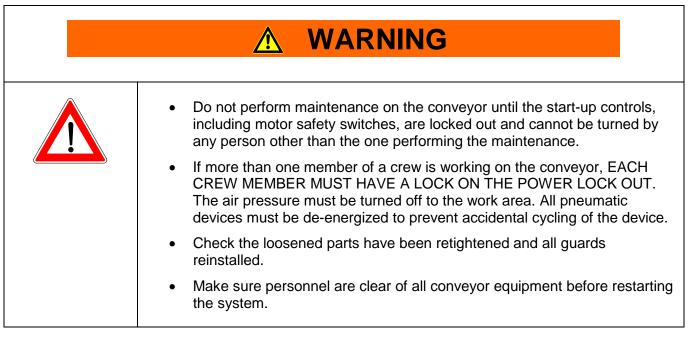

Annual

A complete inspection of conveyor equipment, parts, and proper operations to include safety tests. MHS Conveyor recommend inspecting for the following but not limited to:

WARNING

- Prohibit walking or riding on conveyor by anyone.
- Care should be taken when servicing any conveyor to prevent accidental injury.
- All moving parts are potentially dangerous.

Gearmotor

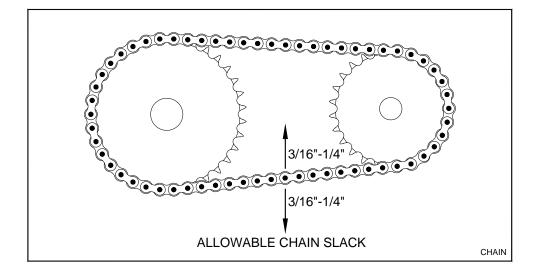

The drive unit should be checked monthly. Check the motor gear case for leaking seals. Check breather on the gear case for dirt accumulation.

Chains and Sprockets

Chains and sprockets should be checked monthly. If either the sprockets or the chain is worn, both should be replaced. Sprockets must be checked for alignment with a straight edge. Clean the chain with a non-flammable solvent and lubricate with 30W synthetic oil. A brush is recommended for oil application.

Check chain tension after initial run-in and then monthly. Tension should be slightly slack, as shown:

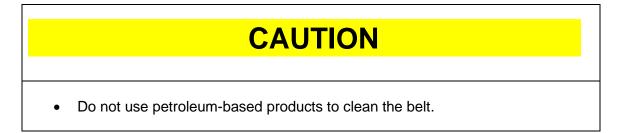

Rollers

Inspect rollers periodically for debris build-up.

Belts

Belts normally need very little care. Clean monthly with compressed air or a stiff brush.

Regreasable Bearings

The drive unit and power take-off have re-greasable bearings. These bearings should be lubricated once during the first six months of operation. Over-greasing will pass grease through the bearing seals/shields and will draw dirt to the bearing. These bearing rotate at a relatively slow speed and should not use grease on a continuing basis.

10.1 Belt Troubleshooting Guide

	Problem Belt	Possible Cause	Remedy
	Belt stopped or moving slower than normal, reducer output shaft is turning properly and all electrical components	Chain is loose and is skipping sprocket teeth	Tension chain. Check sprocket alignment, check for worn teeth.
	are operating normally.	Belt has separated	Replace the entire belt or cut out damaged portion and add new piece with extra lacings.
		Bearings have failed	Locate and replace the bearings
		Belt slipping on drive pulley	See #2 below
		Belt lacing pulled out	See #3 below
		Improper belt tension	Re-tension take-up pulley
		Drive sprocket loose on shaft	Re-tighten sprocket and check for shaft wear
		Belt jammed due to obstruction	Check belt path and remove any obstruction
		Belt mis-tracked on return side	Reference Belt Tracking procedure.
	Belt slipping on drive pulley	Take-up pulley not adjusted properly	Adjust take-up cam in small increments. Do not over-tighten.
		pulley side of belt is	Replace pulley if lagging worn smooth. If slipping is caused by foreign substances in the lagging or bottom of belt, clean by scraping or wire brushing. Do not use solvents on belt or pulley lagging.
		New belt has stretched	Normal. Re-adjusted take-up.
		Seized end pulley or snubber roller bearings	Check and replace as required
		Load too heavy	Remove as required. Re-analyze needs.
		Belt threaded improperly	Check belt path per this manual
3	Belt lacing pulling out	Tension too high	Reduce belt tension at take-up pulley
		Obstruction	Remove obstruction
		Lacing worn out	Replace lacing with Clipper #UCM36SS12

Problem Belt	Possible Cause	Remedy
4.Belt runs to one side	Rollers preceding and at trouble point are not square	Check alignment of pulleys and rollers. Adjust pulleys and rollers as required. See Belt Tracking section of this manual.
	Build-up of foreign material on rollers and pulleys	Clean rollers and pulleys. Do not use solvents.
	Conveyor not level	Level conveyor bed
	Bowed belt	lf belt is new, load tension may straighten it. Otherwise, replace.
	Pulley bearing set screws loose allowing pulleys to walk to one side	Loosen belt and reposition the pulley centered in the frame. Retighten the set screws and center the belt on the pulley.
	Worn bearings	Check and replace.
	Belt not joined securely at lacing	Re-cut belt ends square and re- lace.
	Off center loading	Correct loading conditions.
5.Rips at or near edge of	Obstruction	Remove obstruction
belting	Belt running against conveyor frame	See Belt Tracking section of this manual.
	Loose lacing	Check lacing for tightness and general condition. Check if belt is chamfered on corners.
5.Conveyor belt jerks during operation	Too much slack in drive chain which is jumping the sprocket	Adjust chain tension, check for worn sprockets.
	Chain climbing the sprocket	See "Chains & Sprockets" #8
7.Gouging of top cover	Obstruction	Locate and remove obstruction
	Damaged return idler or snubber pulley	Verify return idlers and snubber pulleys are spinning freely and have no material build-up.
B.Severe wear on drive	Belt slipping on drive pulley	See #2 above
pulley side of belting	Frozen or sticking rollers or pulleys	Replace bad pulleys or rollers
	Slider bed damage or misalignment	Check slider bed for smoothness and alignment at joints
9 Excessive belt stretching	Tension too great	Reduce belt tension by take-up adjustment

10.2 Gearmotor Troubleshooting Guide

	Problem - Motor/Reducer	Possible Cause	Remedy
1.	Motor will not start	No line voltage	Check emergency stops and reset. Check fuses and wiring for open circuit. Check thermal overload protection device. Check limit switches, starter and relays for faulty contacts or mechanical fault. Check voltage at source. Check control circuit voltage.
		Low line voltage	Check for low resistance short on line.
		Conveyor overloaded or jammed	Check for foreign material in chain and sprockets. Check for material between belt and pulleys. Check conveyor belt tension. Remove product overloading from conveyor and address cause. Check chain tension.
		Burned out motor	Replace motor with spare and send defective motor to authorized repair station.
		Failure of electrical component	Check photoelectric control relay, timing modules and start/stop pushbuttons.
2.	Motor running excessively hot	Drag on conveyor	Inspect entire conveyor for obstruction or falling bearings.
	Note:	Lack of reducer lubricant	Check oil level in gear case. Be sure breather plug is open (if used).
	Temperature up to 175º (hot to touch)	Too much lubrication	Drain off excess
	is normal.	Frozen pulley or roller	Check all pulleys and bearings for free rotation. Replace if frozen or difficult to rotate.
		Wrong grade oil	Drain and refill with proper grade
		Electrical	Check wiring and circuits. Take ampere reading and compare with motor rating on name plate.
		Key ramped up on the motor shaft, causing excessive bearing load.	Remove motor to reducer mounting belts. Pull motor back and reposition key, push motor back onto reducer. Binding or excessive resistance should not be felt.
		Overloaded conveyor	Remove excess product. Address cause.
		Mis-threading belt path	Reroute belt path correctly
3.	Reducer runs – drive pulley does not turn	Drive chain broken or disconnected	Replace chain or repair
		Sprockets loose. Also see "Bearings" #8, Chain & sprockets #2 and #6.	Check key and tighten set screws

	Problem - Motor/Reducer	Possible Cause	Remedy
4.	Reducer leaks oil	Defective oil seals on output shaft	Install new oil seals. Replace reducer with spare and send defective reducer to authorized repair facility.
		Oil level too high	Drain off excess
		Loose bearing cover bolts	Tighten as required
		Incorrect size	Check size and replace if necessary
5.	Thermal protectors	Short in motor	See "Motor Will Not Start"
	kicking out	Excessive amps being pulled	Reset starter and check ampere draw. Check for conveyor overload.
6.	Starter overloads	Poor ventilation in control panel	Add vents or fan
	kicking out	Electrical	Check circuits and panel. Check heater size.
7.	Repeated stalling	Excessive product loads	Check if loads or rates have increased since purchase of conveyor
		Motor wiring	Check motor wiring
		Overload on motor	Check conveyor for obstruction causing drag or bearing failure. Check for excessive product load.
8.	Slow to start	Electrical	Check circuits and panel. Take ampere reading.
9.	Excessive noise or motor hums	Lack of lubrication	Check oil level in gear case
		Damaged gears	Replace reducer
		Loose mounting	Tighten bolts
		Faulty bearing	Replace bearing
10.	Motor will run but reducer does not turn	Worn gear in reducer	Replace reducer with spare and send defective reducer to authorized repair station.
		Key between motor and reducer missing	Replace key
11.	Electrical shorts	Loose connection	Check all wire connections. Check fuses.

10.3 Chain & Sprocket Troubleshooting Guide

	Problem - Chain & Sprocket	Possible Cause	Remedy
1.	Excessive slack	Normal wear	Expect rapid chain growth in first two weeks of operation. Check
2.	Sprocket loose on shaft	Loose set screws	Realign sprockets with straight edge and
3.	Wear on tips of sprocket teeth	Chain elongated	Replace chain and sprockets
4.	Abnormal wear on	Excessive chain tension	Align sprockets and reduce tension to
	chain or sprockets	Sprockets misaligned	Realign with straight edge across
		Chain not adequately lubricated	Lubricate chain with approved lubricant;
		Damaged sprocket or chain	Replace damaged component. Check alignment.
		Dirty chain	Clean thoroughly and use approved

10.4 Bearings Troubleshooting Guide

	Problem - Bearings	Possible Cause	Remedy
1.	Excessive vibration	Bearing brinnelled	Locate and replace
2.	Bearing runs	No lubrication	Add approved lubricant
3.	Noise (intermittent)	Loose mounting bolts	Check security or mounting bolts
4.	Shaft rotation in bearing bore	Eccentric locking collar or hub loose	Tighten locking collar in the direction of shaft rotation and/or tighten set
5.	Noise (low pitch)	Bearing brinnelled	Replace
6.	Rough spots felt when	Bearing worn	Replace
7.	Bearing squeals or	Bearing has defect	Replace
8.	Pulley or roller does not	Bearing frozen	Replace bearing or complete roller
	turn	Key sheared off in pulley hub	Check loading. Check
		Set screws slipping on shaft	Tighten and check shaft

Chapter 11: CRUZbelt Replacement Parts Identification

This section is used to identify parts that may require replacement during the life of the conveyor.

Parts that specifically pertain to CRUZbelt are included with illustrations.

A "Recommended Spare Parts List" is published for all conveyor orders of \$20,000 or more. This spare parts list is sent to the purchaser approximately (2) weeks after the order is received. It includes part numbers, description, pricing and recommended quantities to be kept on hand for maintenance.

If you are unable to locate this document another may be obtained by contacting the MHS Conveyor Lifetime Services at 231-798-4547 or Fax 231-798-4549.

11.1 Spare Parts Priority Level Explanations

Level #1

Failure of a priority level #1 spare part ("A" level part) may cause major disruption of system performance.

Priority level 1 spare parts must be on-hand, and available to be replaced in the event of a component failure that could shut down a critical function of a conveyor system.

Priority level 1 spare parts include motors, gear reducers, gearmotor, motorized rollers, air solenoid valves, and related components. The majorities of these parts are purchased from MHS Conveyor vendors and carry their own warranties through these vendors. For more warranty information, see MHS Conveyor Equipment Warranty.

Level #2

Failure of a priority level #2 spare parts ("B" level part) usually is gradual and should not cause a major system disruption.

Priority level 2 spare parts are parts required for smooth system operation and preventative or regular mechanical maintenance.

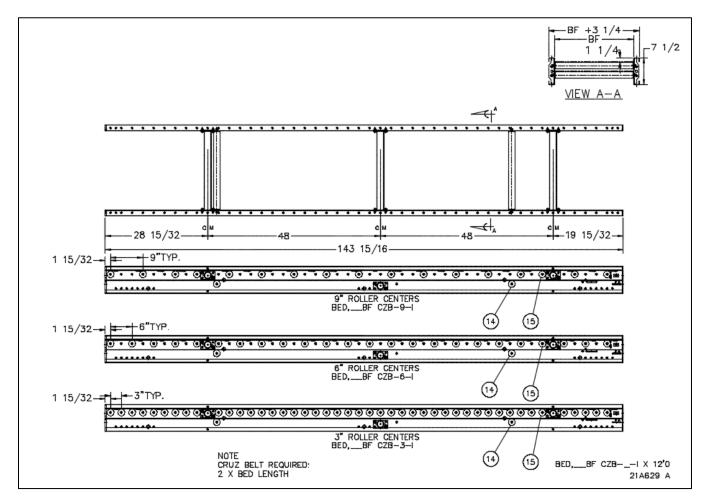

Priority level 2 spare parts include roller chain, sprockets, belt pulleys, rollers, air cylinders, and other related parts whose failure should not stop a conveyor system suddenly. These parts tend to wear out gradually and are not know to fail suddenly.

Level #3

Priority level #3 parts ("C" level part) rarely fails and are easily obtainable.

Priority level 3 spare parts are parts that rarely fail or maybe optionally used by the customer.

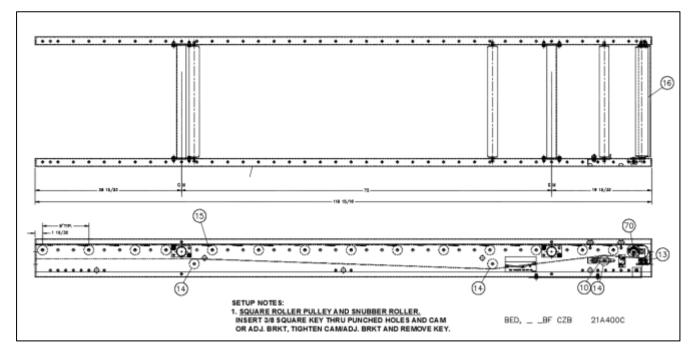

11.2 CRUZbelt Intermediate Bed – Belt On Roller

11.2.1 CRUZbelt Intermediate Bed
